

Technology Integration

Technology Integration is the process of tying all of your systems together so they can communicate with one another and position your team to work effectively.

Technology integration can help avoid these possible issues:

- Rekeying data or using spreadsheets to move data between the systems.
- Transferring data between devices with CD's, USB drives or external hard drives.
- Duplicating data between systems.
- Division of information between departments.

We would provide the following with this service:

- An assessment of your data's complexity within each system.
- A report regarding the integration options.
- Custom development for the integration.
- Testing of the data integrity through the integration process.
- Determining that the departments in your company are getting the data they need through the integration process.
